

## 1 OHBR Checklist: Butterflies & Moths (Lepidoptera)

The list of species recorded in the Outer Hebrides (VC110) is derived from records submitted by various organisations to the National Biodiversity Network Gateway. With the exception of records supplied by OHBR, we cannot verify the accuracy of the identification nor whether these species are still present. Unfortunately not all the records submitted to NBN are publicly available; therefore, although we are aware that a species has been recorded on the islands, it does not appear on the NBN distribution maps.

Over 2500 species have been recorded in the British Isles and so far 538 moths and 17 butterflies appear in the Outer Hebrides checklist. This is not a definitive list; it does not include species recorded in literature or in museum collections, and although moths and butterflies are well documented in comparison with other insects, we are still adding new species to the list. If you record a species not currently listed, and submit your record to OHBR you will be requested to supply further information on how the species was identified to enable us to verify the record. Please note that some species can only be identified by dissection.

The species number is the new checklist number, used in the *Checklist of the Lepidoptera of the British Isles* (Agassiz, D.J.L., Beavan, S.D. & Heckford R.J. 2013). There has been a major review of the taxonomy of Lepidoptera so some of the species names have changed and some species have been moved to another family. We have not adopted the trinomials used in the new checklist as most recorders only use binomials.

We would like to acknowledge the contribution made by John Kemp in revising this checklist and for his advice on the current status of a number of species.

### Notes

1. We have retained the species name of Sweet Gale as *Acronicta euphorbiae*. There is disagreement as to whether *A. cinerea* is a genuine species, we will retain the established name until this is resolved
2. This is a very variable species complex and the species cannot be reliably separated without reference to their genitalia. Therefore, we have retained *Mesapamea secalis* *agg.* for recording purposes.
3. The Ear Moths are all very similar and can only be reliably identified by reference to the genitalia. Therefore, we have retained *Amphipoea oculea* *agg.* for recording purposes.
4. The status of Arran Carpet has been changed and it is now classified as a subspecies of Common Marbled Carpet. It is a race or ecotype of *Dysstroma truncata* which behaves as a species on some Scottish islands.
